Art Unit

2122

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133).
- Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 29 September 2003.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-25 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-25 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
- Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
- 11) ☐ The proposed drawing correction filed on _____ is: a) ☐ approved b) ☐ disapproved by the Examiner.
- If approved, corrected drawings are required in reply to this Office action.
- 12) ☐ The oath or declaration is objected to by the Examiner.

Priority under 35 U.S.C. §§ 119 and 120

- 13) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).
- * See the attached detailed Office action for a list of the certified copies not received.
- 14) ☐ Acknowledgment is made of a claim for domestic priority under 35 U.S.C. § 119(e) (to a provisional application).
- a) ☐ The translation of the foreign language provisional application has been received.
- 15) ☐ Acknowledgment is made of a claim for domestic priority under 35 U.S.C. §§ 120 and/or 121.

DETAILED ACTION

1. This action is in response to the application filed on 04/23/200.

Claim Rejections - 35 USC § 112

2. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

3. Claim 3 and 16 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

4. As per Claim 3, "The method of Claim 3" is not cleared. The Examiner interprets is as "The method of Claim 1".

Specification

5. Claim 16 is objected to because of the following informalities:
6. As per Claim 16, "The system of claim 12" is miss-spelled. The Examiner interprets is as "The system of Claim 15".. Appropriate correction is required.

Claim Rejections - 35 USC § 102

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

Art Unit: 2122

7. Claims 7-9 are rejected under 35 U.S.C. 102(e) as being anticipated by Lektion et al. (US Patent No. 6,418,446) hereafter Lektion.

8. *As Per Claim 7*, Lektion disclosed:

A method for outputting data from an application running on a computer system, the data output as Extensible Markup Language, the method comprising:

-establishing a relationship of the output data and one or more Extensible Markup Language Document Object Model contexts; (see Column 3, Lines 8-10, "It is another object of the present invention to provide this technique **using a DOM tree created** from an XML syntax representation of the source data,").

-building a Document Object Model instance with the one or more contexts; (see Column 3, Lines 10-12, "**creating an output DOM tree** in which the destination data gathered from the source is reformatted and stored.") and (see Column 3, Lines 34-39, "This technique comprises: providing an input data source comprising one or **more records**, wherein each of the records has this dynamically variable record format, and wherein the dynamically variable record format of each record comprises a **plurality** of dynamically variable fields;") and (see Column 3, Lines 52-56, "Optionally, the first **DOM tree may be created** by parsing an Extended Markup Language (XML) representation of the selected record and the second DOM tree may be created by parsing an XML representation of the gather verb specification.") *and*

-outputting the data from the Document Object Model instance as Extensible Markup Language. (see Column 3, Lines 48-52, "The selected record may be formatted as a first

Art Unit: 2122

Document Object Model (DOM) tree, the gather verb specification may be formatted as a second DOM tree, and the output data destination may be formatted as a third DOM tree.”).

9. *As Per Claim 8*, the rejection of claims 7 is incorporated and further Lection disclosed:

-activating plural contexts simultaneously to buffer data for output as a complete

Document Object Model instance. (see Column 3, Lines 34-39, “This technique comprises: providing an input data source comprising one or **more records**, wherein each of the records has this dynamically variable record format, and wherein the dynamically variable record format of each record comprises a **plurality** of dynamically variable fields;”) and (see Column 3, Lines 52-56, “Optionally, the first **DOM tree may be created** by parsing an Extended Markup Language (XML) representation of the selected record and the second DOM tree may be created by parsing an XML representation of the gather verb specification.”)

10. *As Per Claim 9*, the rejection of claims 8 is incorporated and further Lection disclosed:

-creating a node for an output data; and ensuring the correct cardinality of the created

node. (see Column 3, Lines 48-52, “The selected record may be formatted as a first Document Object Model (DOM) tree, the gather verb specification may be formatted as a second DOM tree, and the output data destination may be formatted as a third DOM tree.”).

11. Claims 23-25 are rejected under 35 U.S.C. 102(e) as being anticipated by Stefaniak (US Patent No. 6,550,054).

12. *As Per Claim 23*, Stefaniak disclosed:

A method for modeling a legacy computer system comprising:

-identifying incidents of applications of the legacy computer system that output data;

(see Column 1, Lines 41-47, "An object of the present invention is to provide a method for **reading and interpreting** terminal-based screen **applications** in order to generate extensible Markup Language Metadata Interchange (XMI) representation of the UML. Another object of the present invention is to provide a method for capturing and recording screen relationships and dependencies.").

-associating the incidents with an Extensible Markup Language schema; (see Column 2, Lines 48-51, "FIG. 9 is a diagram that illustrates a UML modeling tool user interface that graphically displays a legacy program by interpreting an **XML** file in accordance with the present invention."). *and*

-defining a control flow graph of the output incidents; (see FIG. 3, Column 2, Lines 29-30, "FIG. 3 is a diagram that shows an end to end process flow from a legacy program to a UML model.") *and*

-creating a specification to modify the legacy computer system applications to provide output from a Document Object Model instance as Extensible Markup Language. (see Column 2, Lines 39-45, "Referring now to FIG. 3, a diagram that shows an end-to-end process flow from a legacy program to an XML/UML file is shown. The process flow begins with any terminal

Art Unit: 2122

based legacy application 30, which produces application terminal screens 31. The terminal screens are discovered using the transform navigator 19, which produces application and screen specifications 32.”).

13. *As Per Claim 24*, the rejection of claims 23 is incorporated and further Stefaniak disclosed:

-automatically modifying the legacy computer system applications in accordance with the specification. (see Column 1, Lines 58-67, “These and other objects, which will become apparent as the invention is described in detail below, are provided in a computer-implemented method that **automatically** converts text-based screen applications of a legacy computer system into a graphical-based representation thereof. The method includes the steps of transforming a terminal-based screen **application** into an **application specification**; converting the application specification into a modeling language-based representation; and, displaying the modeling language-based representation with a graphical user interface.”).

14. *As Per Claim 25*, Stefaniak disclosed: *A system for modeling an output application of a legacy computer system comprising:*

-a modeling engine interfaced with the legacy computer system, the modeling engine operable to analyze an application loaded on the legacy computer system to identify incidents within the application that output data from the legacy computer system; (see Column 1, Lines 41-47, “An object of the present invention is to provide a method for **reading and interpreting**

Art Unit: 2122

terminal-based screen **applications** in order to generate extensible Markup Language Metadata Interchange (XMI) representation of the UML. Another object of the present invention is to provide a method for capturing and recording screen relationships and dependencies.”) and (see Column 1, Lines 58-67, “These and other objects, which will become apparent as the invention is described in detail below, are provided in a computer-implemented **method** that automatically converts text-based screen applications of a **legacy computer system** into a graphical-based representation thereof. The method includes the steps of transforming a terminal-based screen application into an application specification; converting the application specification into a **modeling** language-based representation; and, displaying the **modeling** language-based representation with a graphical user interface.”).

-a control flow graph of the output operations within the applications, the control flow graph having plural nodes, each node associated with an output incident; (see FIG. 3, Column 2, Lines 29-30, “FIG. 3 is a diagram that shows an end to end process flow from a legacy program to a UML model.”) and (see Column 5, Lines 39-57, “Referring now to FIG. 3, a diagram that shows an end-to-end process flow from a legacy program to an XML/UML file is shown. The process flow begins with any terminal based legacy **application 30, which produces application terminal screens 31**. The terminal screens are discovered using the transform navigator 19, which produces application and screen specifications 32. The application and screen specifications 32 are then applied to the file warehouse 21, which produces the project file reference model 27. The model 27 is applied to the terminal-to-XML 20, which produces a UML model 34 in a MOF compliant repository. The UML model is then applied to the UML model to **XMI/UML DTD** generator 22, which produces XMI/UML DTD streams 35.

Art Unit: 2122

The streams 35 may be used for several purposes, including **transmitting legacy screen based application specifications over a network to modeling tools**. From the modeling tools the application specifications could be viewed in an object oriented way compliant with the UML standard.”). *and*

*-a graphical user interface in communication with the modeling engine, the graphical user interface operable to display the control flow graph and the incidents; wherein the graphical user interface maps the incidents of the applications with the control flow graph and an Extensible Markup Language schema. (see Column 1, Lines 58-67, “These and other objects, which will become apparent as the invention is described in detail below, are provided in a computer-implemented **method** that automatically converts text-based screen applications of a **legacy computer system** into a graphical-based representation thereof. The method includes the steps of transforming a terminal-based screen application into an application specification; converting the application specification into a **modeling** language-based representation; and, displaying the **modeling** language-based representation with a **graphical user interface**.”).*

Claim Rejections - 35 USC § 103

15. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

16. Claims 1-2, 4-6, 20-21 are rejected under 35 U.S.C. 103(a) as being unpatentable over Stefaniak (US Patent No. 6,550,054) in view of van Elkeren et al. (US Patent No. 6,618,852) hereafter van Elkeren.

17. *As Per Claim 1*, Stefaniak disclosed: *A method for reporting data from a legacy computer system using Extensible Markup Language, the method comprising:*

-generating a model of the legacy computer system; (see Column 1, Lines 58-67, “These and other objects, which will become apparent as the invention is described in detail below, are provided in a computer-implemented **method** that automatically converts text-based screen applications of a **legacy computer system** into a graphical-based representation thereof. The method includes the steps of transforming a terminal-based screen application into an application specification; converting the application specification into a **modeling** language-based representation; and, displaying the **modeling** language-based representation with a graphical user interface.”).

-mapping the model of the legacy computer system to an Extensible Markup Language schema; (see Column 1, Line 67 to column 2, lines 1-4, “This method also includes the capability of generating **document type definitions** of the modeling language-based representation, which enables transmission of the representation among modeling tools.”).
“document type definitions” is XML schema. *and*

Art Unit: 2122

-automatically modifying one or more applications of the legacy computer system, (see Column 5, Lines 39-43, "Referring now to FIG. 3, a diagram that shows an end-to-end process flow from a legacy program to an XML/UML file is shown. The process flow begins with any terminal based legacy **application 30, which produces application terminal screens 31**") *the modified application operable to output data written from the legacy computer system in Extensible Markup Language.* (see Column 5, Lines 43-57, "The terminal screens are discovered using the transform navigator 19, which produces application and screen specifications 32. The application and screen specifications 32 are then applied to the file warehouse 21, which produces the project file reference model 27. The model 27 is applied to the terminal-to-XML 20, which produces a UML model 34 in a MOF compliant repository. The UML model is then applied to the UML model to **XMI/UML DTD generator 22**, which produces XMI/UML DTD streams 35. The streams 35 may be used for several purposes, including **transmitting legacy screen based application specifications over a network to modeling tools**. From the modeling tools the application specifications could be viewed in an object oriented way compliant with the UML standard.").

Stefaniak didn't explicitly disclose using a Document Object Model. However, van Elkeren taught *automatically modifying one or more applications of the legacy computer system, the modified application operable to output data written using a Document Object Model from the legacy computer system in Extensible Markup Language.* (see Column 12, Lines 5-10, "Preferably, a standard API, the XML DOM (Document Object Model) is used to access and manipulate XML data. The DOM provides a standard set of properties, methods, and events for program developers to use. This set of standards, the object model, provides a simple

Art Unit: 2122

means of reading and writing data to and from an XML tree structure.”). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to use DOM, as suggested by van Elkeren, to apply to output XML data. The modification would have been obvious because one of ordinary skill in the art would have been motivated to provide a simple means of reading and writing data to and from an XML tree structure.

18. *As Per Claim 2*, the rejection of claim 1 is incorporated and further Stefaniak disclosed:

-providing the legacy computer system with a writer engine, the writer engine having the Extensible Markup Language Schema loaded as a data file; (see Column 1, Line 67 to column 2, lines 1-4, “This method also includes the capability of generating **document type definitions** of the modeling language-based representation, which enables transmission of the representation among modeling tools.”). “document type definitions” is XML schema. *and*

Stefaniak didn’t explicitly disclose populating a Document Object Model. However, van Elkeren taught *calling the writer engine with the modified applications, the writer engine populating the Document Object Model according to the Extensible Markup Language schema by building a Document Object Model instance with one or more contexts.* (see Column 12, Lines 5-10, “Preferably, a standard API, the XML DOM (Document Object Model) is used to access and manipulate XML data. The DOM provides a standard set of properties, methods, and events for program developers to use. This set of standards, the object model, provides a simple means of reading and writing data to and from an XML tree structure.”). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to populate DOM, as suggested by van Elkeren, to apply to output XML data. The

Art Unit: 2122

modification would have been obvious because one of ordinary skill in the art would have been motivated to provide a simple means of reading and writing data to and from an XML tree structure.

19. *As Per Claim 4, Stefaniak disclosed: A system for reporting data from a legacy computer system in an Extensible Markup Language format, the system comprising:*

-a modeling engine in communication with the legacy computer system, the modeling engine operable to generate a model of reported data written by an application residing on the legacy computer system; (see Column 1, Lines 58-67, "These and other objects, which will become apparent as the invention is described in detail below, are provided in a computer-implemented **method** that automatically converts text-based screen applications of a **legacy computer system** into a graphical-based representation thereof. The method includes the steps of transforming a terminal-based screen application into an application specification; converting the application specification into a **modeling** language-based representation; and, displaying the **modeling** language-based representation with a graphical user interface.").

-a mapping engine in communication with the modeling engine, the mapping engine operable to generate a modification specification by mapping the model to an Extensible Markup Language schema; (see Column 5, Lines 43-57, "The terminal screens are discovered using the transform navigator 19, which produces application and screen specifications 32. The application and screen specifications 32 are then applied to the file warehouse 21, which produces the project file reference model 27. The model 27 is applied to the terminal-to-XML

Art Unit: 2122

20, which produces a UML model 34 in a MOF compliant repository. The UML model is then applied to the UML model to XMI/UML DTD generator 22, which produces XMI/UML DTD streams 35. The streams 35 may be used for several purposes, including **transmitting legacy screen based application specifications over a network to modeling tools**. From the modeling tools the application specifications could be viewed in an object oriented way compliant with the UML standard.”). *and*

-a code generation engine in communication with the mapping engine and the legacy computer system, the code generation engine operable to modify legacy computer system application code to directly output data from Extensible Markup Language. (see Column 5, Lines 43-57, “The terminal screens are discovered using the transform navigator 19, which produces application and screen specifications 32. The application and screen specifications 32 are then applied to the file warehouse 21, which produces the project file reference model 27. The model 27 is applied to the terminal-to-XML 20, which produces a UML model 34 in a MOF compliant repository. The UML model is then applied to the UML model to **XMI/UML DTD generator 22, which produces XMI/UML DTD streams 35**. The streams 35 may be used for several purposes, including **transmitting legacy screen based application specifications over a network to modeling tools**. From the modeling tools the application specifications could be viewed in an object oriented way compliant with the UML standard.”).

Stefaniak didn't explicitly disclose using a Document Object Model. However, van Elkeren taught *a code generation engine in communication with the mapping engine and the legacy computer system, the code generation engine operable to modify legacy computer system application code to directly output data from a Document Object Model as Extensible*

Art Unit: 2122

Markup Language. (see Column 12, Lines 5-10, "Preferably, a standard API, the XML DOM (Document Object Model) is used to access and manipulate XML data. The DOM provides a standard set of properties, methods, and events for program developers to use. This set of standards, the object model, provides a simple means of reading and writing data to and from an XML tree structure."). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to use DOM, as suggested by van Elkeren, to apply to output XML data. The modification would have been obvious because one of ordinary skill in the art would have been motivated to provide a simple means of reading and writing data to and from an XML tree structure.

20. *As Per Claim 5*, the rejection of claim 4 is incorporated and further Stefaniak disclosed:

-a context table associated with the legacy computer system, the context table providing the Extensible Markup Language schema to the legacy computer system; and

-a writer engine loaded on the legacy computer system and having the Extensible Markup Language schema stored as a data file, the writer engine communicating with the modified legacy computer system applications to buffer data in plural contexts for output as Extensible Markup Language. (see Column 6, Lines 41-58, "Referring now to FIG. 5C, at the connector C, a UML attribute and a UML datatype tag are assigned for each field name associated with the screen (block 65). Next, all the operations of the screen are initialized and transmitted as the operations of the UML class created for that screen (block 66). This is followed by making an inquiry whether or not there are any more screens in the UML package

Art Unit: 2122

(block 67). **If the answer to this enquiry is yes, then a return is made back to block 62 (FIG. 5B) as denoted by a connector E.** If on the other hand, the answer to the above inquiry is no then a further inquiry is made to determine whether or not there are any more UML packages (block 68). **If the answer to this inquiry is yes, then a return is made back to the block 61 (FIG. 5B) as denoted by a connector D.** If on the other hand, the answer to the above inquiry is no, then a step of saving the tempfile as tempfile.txt is executed (block 69). After this, the process ends (bubble 70).”).

Stefaniak didn't explicitly disclose using a Document Object Model. However, van Elkeren taught *a writer engine loaded on the legacy computer system and having the Extensible Markup Language schema stored as a data file, the writer engine communicating with the modified legacy computer system applications to buffer data in plural contexts within a Document Object Model for output as Extensible Markup Language.* (see Column 12, Lines 5-10, “Preferably, a standard API, the XML DOM (Document Object Model) is used to access and manipulate XML data. The DOM provides a standard set of properties, methods, and events for program developers to use. This set of standards, the object model, provides a simple means of reading and writing data to and from an XML tree structure.”). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to use DOM, as suggested by van Elkeren, to apply to output XML data. The modification would have been obvious because one of ordinary skill in the art would have been motivated to provide a simple means of reading and writing data to and from an XML tree structure.

21. *As Per Claim 6*, the rejection of claim 5 is incorporated and further Stefaniak disclosed:

- the writer engine is coded in the computer language of the legacy computer system.

(see Column 6, Lines 41-58, "Referring now to FIG. 5C, at the connector C, a UML attribute and a UML datatype tag are assigned for each field name associated with the screen (block 65). Next, all the operations of the screen are initialized and transmitted as the operations of the UML class created for that screen (block 66). This is followed by making an inquiry whether or not there are any more screens in the UML package (block 67). **If the answer to this enquiry is yes, then a return is made back to block 62 (FIG. 5B) as denoted by a connector E.** If on the other hand, the answer to the above inquiry is no then a further inquiry is made to determine whether or not there are any more UML packages (block 68). **If the answer to this inquiry is yes, then a return is made back to the block 61 (FIG. 5B) as denoted by a connector D.** If on the other hand, the answer to the above inquiry is no, then a step of saving the tempfile as tempfile.txt is executed (block 69). After this, the process ends (bubble 70).") and (see Column 8, Lines 52-55, "when the program code is loaded into and executed by a machine, such as a computer, the machine becomes an apparatus for practicing the invention.").

22. ***As Per Claim 20, Stefaniak disclosed: A method for outputting data from a legacy computer system from a DOM instance as Extensible Markup Language, the method comprising:***

-modifying an application of the legacy computer system to output data having a schema element; (see Fig. 6).

-generating data from the modified application; (see Column 2, Lines 33-36, "FIGS. 5A through 5C is a combined flow chart of the method for generating an UML/XML representation

Art Unit: 2122

of the file reference model created by the method described with reference to FIG. 4 above.”)
and (see Column 6, Lines 56-57, “the answer to the above inquiry is no, then a step of saving the tempfile as **tempfile.txt** is executed (block 69).”).

- *aligning the schema element and the current context*; (see Column 6, Lines 25-33, “Referring now to FIG. 5B at the connector A, an inquiry is made as to whether or not there are any more sub-projects in the file reference model of the project (diamond 58). If the answer to this inquiry is yes, **then a return** is made back to the block 52 (FIG. 5A) as denoted by a connector B. On the other hand, if the answer to this inquiry is no, **then a command to create a "tempfile"** is executed (block 59). Next the project name of the file reference model is tagged to this tempfile as a UML model name (block 60).”).

- *writing the output data schema element to a current one of plural contexts of an Extensible Markup Language schema*; (see Column 6, Lines 59-67 to Column 7, Lines 1-4, “Referring now to FIG. 6 where a flowchart depicting the process of generating an XML file representation of the UML model created by the process described in FIG. 5A through 5C. The process begins with a start bubble 72, followed by a process of parsing the tempfile (block 73) for the UML model created in FIGS. 5A, 5B and 5C. Next, a call 74 is made to the various UML methods to build a model in memory. This is followed by a step 75 of reading the UML model from memory, created in the previous step, and building an XML file representation of the model. Finally, the XML file representation created in the previous step is **saved as <projectname.xml>** (block 76) and the process ends (bubble 77).”). *and*

Stefaniak didn't explicitly disclose using a Document Object Model. However, van Elkeren taught *populating a Document Object Model with the data to output an Extensible*

Art Unit: 2122

Markup Language instance. (see Column 12, Lines 5-10, "Preferably, a standard API, the XML DOM (Document Object Model) is used to access and manipulate XML data. The DOM provides a standard set of properties, methods, and events for program developers to use. This set of standards, the object model, provides a simple means of reading and writing data to and from an XML tree structure."). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to use DOM, as suggested by van Elkeren, to apply to output XML data. The modification would have been obvious because one of ordinary skill in the art would have been motivated to provide a simple means of reading and writing data to and from an XML tree structure.

23. ***As Per Claim 21***, the rejection of claims 20 is incorporated and further Stefaniak disclose ***aligning the schema element further comprises:***

-determining that the schema element is a descendant of the current context; (see Column 6, Lines 25-33, "Referring now to FIG. 5B at the connector A, an inquiry is made as to whether or not there are any more sub-projects in the file reference model of the project (diamond 58). **If** the answer to this inquiry is yes, **then a return** is made back to the block 52 (FIG. 5A) as denoted by a **connector B**. On the other hand, **if** the answer to this inquiry is no, **then a command to create a "tempfile"** is executed (block 59). Next the project name of the file reference model is tagged to this tempfile as a UML model name (block 60)."). ***and***

-creating the Extensible Markup Language tags down through the schema element.

(see Column 6, Lines 34-40, "This step is followed by the step of **tagging** the file reference sub-

Art Unit: 2122

model name as a UML package name to the tempfile (block 61). Next, each screen specification in the UML package created in the previous step is parsed (block 62). Subsequently for each screen name, a UML class tag is assigned (block 63). The process illustration continues as denoted by a connector C.”)

24. Claims 10-14 are rejected under 35 U.S.C. 103(a) as being unpatentable over Lektion et al. (US Patent No. 6,418,446) hereafter Lektion in view of Stefaniak (US Patent No. 6,550,054).

25. *As Per Claim 10*, the rejection of claims 7 is incorporated and further Lektion disclosed:
-generating output data with an application; (see Column 3, Lines 48-52, “The selected record may be formatted as a first Document Object Model (DOM) tree, the gather verb specification may be formatted as a second DOM tree, and the output data destination may be formatted as a third DOM tree.”).

-outputting data from a Document Object Model instance from the writer engine according to the Extensible Markup Language schema. (see Column 3, Lines 8-12, “It is another object of the present invention to provide this technique **using a DOM tree created from** an XML syntax representation of the source data, and **creating an output DOM tree** in which the destination data gathered from the source is reformatted and stored.”).

Lecture didn't explicitly disclose using a writer engine. However, Stefaniak taught *calling a writer engine with the application; providing the generated output data to the writer engine*. (see Column 5, Lines 43-57, "The terminal screens are discovered using the transform navigator 19, which produces application and screen specifications 32. The application and screen specifications 32 are then applied to the file warehouse 21, which produces the project file reference model 27. The model 27 is applied to the terminal-to-XML 20, which produces a UML model 34 in a MOF compliant repository. The UML model is then applied to the UML model to **XMI/UML DTD** generator 22, which produces XMI/UML DTD streams 35. The streams 35 may be used for several purposes, including **transmitting legacy screen based application specifications over a network to modeling tools**. From the modeling tools the application specifications could be viewed in an object oriented way compliant with the UML standard.""). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to incorporate **XMI/UML DTD** generator, as suggested by Stefaniak into the system of Lecture, to produce XMI/UML DTD streams. The modification would have been obvious because one of ordinary skill in the art would have been motivated to provide a simple means to generate XML codes.

26. *As Per Claim 11*, the rejection of claims 10 is incorporated and further Lecture didn't explicitly disclose a legacy computer system application. However, Stefaniak teaches *a legacy computer system application* (see Column 1, Lines 58-67, "These and other objects, which will become apparent as the invention is described in detail below, are provided in a computer-implemented **method** that automatically converts text-based screen applications of a **legacy**

Art Unit: 2122

computer system into a graphical-based representation thereof. The method includes the steps of transforming a terminal-based screen application into an application specification; converting the application specification into a **modeling** language-based representation; and, displaying the **modeling** language-based representation with a graphical user interface.”). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to use legacy computer system, as suggested by Stefaniak , to build DOM instance of Lection. The modification would have been obvious because one of ordinary skill in the art would have been motivated to make application run on more computer systems.

27. *As Per Claim 12*, the rejection of claims 11 is incorporated and further Lection didn't explicitly disclose the writer engine comprises an application run in the computer language of the legacy computer system application. However, Stefaniak teaches *the writer engine comprises an application run in the computer language of the legacy computer system application* (see Column 6, Lines 41-58, “Referring now to FIG. 5C, at the connector C, a UML attribute and a UML datatype tag are assigned for each field name associated with the screen (block 65). Next, all the operations of the screen are initialized and transmitted as the operations of the UML class created for that screen (block 66). This is followed by making an inquiry whether or not there are any more screens in the UML package (block 67). **If the answer to this enquiry is yes, then a return is make back to block 62 (FIG. 5B) as denoted by a connector E.** If on the other hand, the answer to the above inquiry is no then a further inquiry is made to determine whether or not there are any more UML packages (block 68). **If the answer to this inquiry is yes, then a return is made back to the block 61 (FIG. 5B) as denoted by a connector D.** If on the other

Art Unit: 2122

hand, the answer to the above inquiry is no, then a step of saving the tempfile as tempfile.txt is executed (block 69). After this, the process ends (bubble 70).”) and (see Column 8, Lines 52-55, “when the program **code is loaded into and executed by a machine**, such as a computer, the machine becomes an apparatus for practicing the invention.”). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to use application in computer language, as suggested by Stefaniak, to run on legacy computer system. The modification would have been obvious because one of ordinary skill in the art would have been motivated to make application more flexible to run in different computer systems.

28. *As Per Claim 13, Lektion disclosed: A system for outputting data from a Document*

Object Model as Extensible Markup Language, the system comprising:

- a computer system having an application that outputs data; (see Column 3, Lines 48-52, “The selected record may be formatted as a first Document Object Model (DOM) tree, the gather verb specification may be formatted as a second DOM tree, and the **output data** destination may be formatted as a third **DOM tree**.”).

Lektion didn’t explicitly disclose using a writer engine. However, Stefaniak taught *a engine operable to write the output data in plural active contexts; wherein the application calls the writer engine when the application outputs data, the writer engine operable to build a Document Object Model instance for output of the data in accordance with the Extensible Markup Language schema.* (see Column 5, Lines 43-57, “The terminal screens are discovered using the transform navigator 19, which produces application and screen specifications 32. The

Art Unit: 2122

application and screen specifications 32 are then applied to the file warehouse 21, which produces the project file reference model 27. The model 27 is applied to the terminal-to-XML 20, which produces a UML model 34 in a MOF compliant repository. The UML model is then applied to the UML model to **XMI/UML DTD** generator 22, which produces XMI/UML DTD streams 35. The streams 35 may be used for several purposes, including **transmitting legacy screen based application specifications over a network to modeling tools**. From the modeling tools the application specifications could be viewed in an object oriented way compliant with the UML standard.”). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to incorporate **XMI/UML DTD** generator, as suggested by Stefaniak into the system of Lektion, to produces XMI/UML DTD streams. The modification would have been obvious because one of ordinary skill in the art would have been motivated to provide a simple means to generate XML codes.

As Per Claim 14, the rejection of claims 13 is incorporated and further Lektion didn't explicitly disclose aligned element. However, Stefaniak taught *the writer engine populates a Document Object Model as a schema element aligned with the current one of the contexts by creating Extensible Markup Language tagged nodes down through the schema element of the output data if the schema element of the output data is a descendant of the current context*. (see Column 6, Lines 25-33, “Referring now to FIG. 5B at the connector A, an inquiry is made as to whether or not there are any more sub-projects in the file reference model of the project (diamond 58). **If** the answer to this inquiry is yes, **then a return** is made back to the block 52 (FIG. 5A) as denoted by a connector B. On the other hand, **if** the answer to this inquiry is no,

Art Unit: 2122

then a command to create a "tempfile" is executed (block 59). Next the project name of the file reference model is tagged to this tempfile as a UML model name (block 60).") and (see Column 6, Lines 41-58, "Referring now to FIG. 5C, at the connector C, a UML attribute and a UML **datatype tag are assigned** for each field name associated with the screen (block 65). Next, all the operations of the screen are initialized and transmitted as the operations of the UML class created for that screen (block 66). This is followed by making an inquiry whether or not there are any more screens in the UML package (block 67). If the answer to this enquiry is yes, then a return is made back to block 62 (FIG. 5B) as denoted by a connector E. If on the other hand, the answer to the above inquiry is no then a further inquiry is made to determine whether or not there are any more UML packages (block 68). If the answer to this inquiry is yes, then a return is made back to the block 61 (FIG. 5B) as denoted by a connector D. If on the other hand, the answer to the above inquiry is no, then a step of saving the tempfile as tempfile.txt is executed (block 69). After this, the process ends (bubble 70)."). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to incorporate the teaching of Stefaniak into the system of Lection, to align the elementas. The modification would have been obvious because one of ordinary skill in the art would have been motivated to easily process the preformatted documents.

29. Claim 3 is rejected under 35 U.S.C. 103(a) as being unpatentable over Stefaniak (US Patent No. 6,550,054) in view of van Elkeren et al. (US Patent No. 6,618,852) hereafter van Elkeren further in view of Sandhu et al. (US Patent No. 6,347,307) hereafter Sandhu.

30. *As Per Claim 3*, the rejection of claim 1 is incorporated and further Stefaniak and van Elkeren taught written using a Document Object Model (see van Elkeren , Column 12, Lines 5-10, “Preferably, a standard API, the XML DOM (Document Object Model) is used to access and manipulate XML data. The DOM provides a standard set of properties, methods, and events for program developers to use. This set of standards, the object model, provides a simple means of reading and writing data to and from an XML tree structure.”). Stefaniak and van Elkeren didn’t explicitly disclose applying XSLT stylesheets. However, Sandhu taught *applying one or more XSLT stylesheets to restructure the Document Object Model instance for outputting data in a predetermined format*. (see Column 50, Lines 24-30, “Next, the Connect Processor invokes a XSLT processor 1450--an off-the-shelf component (e.g., International Business Machines Corp.'s "Alphaworks")--to apply the rules of the XSL stylesheet 1440 to DOM tree 1430 (step 1520). This process results in the generation of a FinXML document 1460 (step 1530) that can be used by the CFOWeb System.”). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to use XSLT stylesheets, as suggested by Sandhu, to apply to DOM. The modification would have been obvious because one of ordinary skill in the art would have been motivated to make the document usable by other computer system.

31. Claims 15-18 are rejected under 35 U.S.C. 103(a) as being unpatentable over Lektion et al. (US Patent No. 6,418,446) hereafter Lektion in view of Stefaniak (US Patent No. 6,550,054) further in view of Shanmugasundaram et al. “Relational Databases for Querying XML

Art Unit: 2122

Documents: Limitations and Opportunities”. Proceedings of the 25th VLDB Conference, Edinburgh, Scotland, 1999, hereafter Shanmugasundaram.

32. *As Per Claim 15*, the rejection of claims 14 is incorporated and further Lektion and Stefaniak didn't explicitly disclose traverse the Extensible Markup Language tagged nodes for the current context up to the minimal mutual ancestor. However, Shanmugasundaram taught *the writer engine is further operable to determine a minimal mutual ancestor of the schema element and the current context and to traverse the Extensible Markup Language tagged nodes for the current context up to the minimal mutual ancestor and to create Extensible Markup Language tags for the schema element down from the mutual ancestor.* (see page 5, left hand column last 2 lines to right hand column, lines 1-14, “Do a depth first traversal of the DTD graph, starting at the element node for which we are constructing relations. Each node is marked as “visited” the first time it is reached and is unmarked it once all its children have been traversed. If an unmarked node in the DTD graph is reached during depth first traversal, a new node bearing the same name is created in the element graph. In addition, a *regular* edge is created from the most recently created node in the element graph with the same name as the DFS parent of the current DTD node to the newly created node. If an attempt is made to traverse an already marked DTD node, then a *backpointer* edge is added from the most recently created node in the element graph to the most recently created node in the element graph with the same name as the marked DTD node.”), and (see page 6, left hand column last 2 lines to right hand column first three lines, “Finally, of the mutually recursive elements all having indegree one (such as *monograph* and *editor* in Figure 8), one of them is made a separate relation. We can find such

Art Unit: 2122

mutually recursive elements by looking for strongly connected components in the DTD graph.”). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to use traversed technique, as suggested by Sandhu, to construct DTD node. The modification would have been obvious because one of ordinary skill in the art would have been motivated to lookup node in DTD graph.

33. *As Per Claim 16*, the rejection of claims 15 is incorporated and further Lektion and Stefaniak disclose *the computer system comprises a legacy computer system*. (see Stefaniak, Column 1, Lines 58-67, “These and other objects, which will become apparent as the invention is described in detail below, are provided in a computer-implemented **method** that automatically converts text-based screen applications of a **legacy computer system** into a graphical-based representation thereof. The method includes the steps of transforming a terminal-based screen application into an application specification; converting the application specification into a **modeling** language-based representation; and, displaying the **modeling** language-based representation with a graphical user interface.”).

34. *As Per Claim 17*, the rejection of claims 16 is incorporated and further Lektion and Stefaniak disclose *the application comprises a legacy computer system application modified to output an Extensible Markup Language schema element with output data*. (see Stefaniak, Column 5, Lines 43-57, “The terminal screens are discovered using the transform navigator 19, which produces application and screen specifications 32. The application and screen

Art Unit: 2122

specifications 32 are then applied to the file warehouse 21, which produces the project file reference model 27. The model 27 is applied to the terminal-to-XML 20, which produces a UML model 34 in a MOF compliant repository. The UML model is then applied to the UML model to **XMI/UML DTD** generator 22, which produces XMI/UML DTD streams 35. The streams 35 may be used for several purposes, including **transmitting legacy screen based application specifications over a network to modeling tools**. From the modeling tools the application specifications could be viewed in an object oriented way compliant with the UML standard.”).

35. *As Per Claim 18*, the rejection of claims 16 is incorporated and further Lection and Stefaniak disclose *the writer engine is written in the code of the legacy computer system*. (see Stefaniak , Column 6, Lines 41-58, “Referring now to FIG. 5C, at the connector C, a UML attribute and a UML datatype tag are assigned for each field name associated with the screen (block 65). Next, all the operations of the screen are initialized and transmitted as the operations of the UML class created for that screen (block 66). This is followed by making an inquiry whether or not there are any more screens in the UML package (block 67). **If the answer to this enquiry is yes, then a return is make back to block 62 (FIG. 5B) as denoted by a connector E**. If on the other hand, the answer to the above inquiry is no then a further inquiry is made to determine whether or not there are any more UML packages (block 68). **If the answer to this inquiry is yes, then a return is made back to the block 61 (FIG. 5B) as denoted by a connector D**. If on the other hand, the answer to the above inquiry is no, then a step of saving the tempfile as tempfile.txt is executed (block 69). After this, the process ends (bubble 70).”) and

Art Unit: 2122

(see Column 8, Lines 52-55, "when the program **code is loaded into and executed by a machine**, such as a computer, the machine becomes an apparatus for practicing the invention.").

36. Claim 19 is rejected under 35 U.S.C. 103(a) as being unpatentable over Lektion et al. (US Patent No. 6,418,446) hereafter Lektion in view of Stefaniak (US Patent No. 6,550,054) further in view of Shanmugasundaram et al. "Relational Databases for Querying XML Documents: Limitations and Opportunities". Proceedings of the 25th VLDB Conference, Edinburgh, Scotland, 1999, hereafter Shanmugasundaram, further in view of Vermeire et al. (US Patent No. 6,209,124) hereafter Vermeire.

37. *As Per Claim 19*, the rejection of claims 18 is incorporated and further Lektion, Stefaniak and Shanmugasundaram didn't explicitly disclose cobol. However, Vermeire taught *the code comprises COBOL*. (see Column 18, Lines 18-21, "Alternatively, the XML document of Table 20 could have been generated from **COBOL** source code which would have appeared as in Table 22."). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to use COBOL, as suggested by Vermeire, as the application language. The modification would have been obvious because one of ordinary skill in the art would have been motivated to utilize a constructed intermediary acting with the host machine and its program applications. (see Column 5, Lines 7-17, "The invention utilizes a constructed intermediary which is user defined based upon the application language utilized by the host computer. The intermediary is further constructed to encompass the machine architecture and

Art Unit: 2122

data structures involved in the host machine and application programs. This then allows the intermediary to function to restructure in-memory binary data streams received from the host into XML documents and to restructure XML documents into binary data streams capable of acting with the host machine and its program applications.”).

38. Claim 22 is rejected under 35 U.S.C. 103(a) as being unpatentable over Stefaniak (US Patent No. 6,550,054) in view of van Elkeren et al. (US Patent No. 6,618,852) hereafter van Elkeren, further in view of Shanmugasundaram et al. “Relational Databases for Querying XML Documents: Limitations and Opportunities”. Proceedings of the 25th VLDB Conference, Edinburgh, Scotland, 1999, hereafter Shanmugasundaram.

39. *As Per Claim 22*, the rejection of claims 21 is incorporated and further Stefaniak and van Elkeren disclosed

- *determining a minimal mutual ancestor of the schema element and the current context*; (see Stefaniak , Column 6, Lines 25-33, “Referring now to FIG. 5B at the connector A, an inquiry is made as to whether or not there are any more sub-projects in the file reference model of the project (**diamond 58**). If the answer to this inquiry is yes, then a return is made back to the block 52 (FIG. 5A) as denoted by a connector B. On the other hand, if the answer to this inquiry is no, then a command to create a "tempfile" is executed (block 59). Next the project name of the file reference model is tagged to this tempfile as a UML model name (block 60).”). and (see Column 6, Lines 25-33, “Next, **an inquiry (block 55)** is made to determine whether or not there are any more screen specifications in the file reference model of the sub-project. If the

Art Unit: 2122

answer to this inquiry is yes, then a return is made back to the block 53. On the other hand, if the answer to this inquiry is no, then the process illustration continues in FIG. 5B as denoted by a connector A.”). “diamond 58” and “block 55” determine the minimal mutual ancestor. *and*

- creating the Extensible Markup Language tags for the schema element down from the mutual ancestor. (see Stefaniak , Column 6, Lines 34-40, “This step is followed by the step of **tagging** the file reference sub-model name as a UML package name to the tempfile (block 61). Next, each screen specification in the UML package created in the previous step is parsed (block 62). Subsequently for each screen name, a UML class tag is assigned (block 63). The process illustration continues as denoted by a connector C.”)

Stefaniak and van Elkeren didn’t explicitly disclose traverse the Extensible Markup Language tagged nodes for the current context up to the minimal mutual ancestor. However, Shanmugasundaram taught *traversing the Extensible Markup Language tags for the current context up to the mutual ancestor* (see page 5, left hand column last 2 lines to right hand column, lines 1-14, “Do a depth first traversal of the DTD graph, starting at the element node for which we are constructing relations. Each node is marked as “visited” the first time it is reached and is unmarked it once all its children have been traversed. If an unmarked node in the DTD graph is reached during depth first traversal, a new node bearing the same name is created in the element graph. In addition, a *regular* edge is created from the most recently created node in the element graph with the same name as the DFS parent of the current DTD node to the newly created node. If an attempt is made to traverse an already marked DTD node, then a *backpointer* edge is added from the most recently created node in the element graph to the most recently

Art Unit: 2122

created node in the element graph with the same name as the marked DTD node.”), and (see page 6, left hand column last 2 lines to right hand column first three lines, “Finally, of the mutually recursive elements all having indegree one (such as *monograph* and *editor* in Figure 8), one of them is made a separate relation. We can find such mutually recursive elements by looking for strongly connected components in the DTD graph.”). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to use traversed technique, as suggested by Sandhu, to construct DTD node. The modification would have been obvious because one of ordinary skill in the art would have been motivated to lookup node in DTD graph.

Conclusion

40. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

41. **Title:** System and method for translating to and from hierarchical information systems. **USPN:** 6,523,042.

42. **Title:** Method for converting relational data into a structured document. **USPN:** 6,604,100.

43. **Title:** METHOD AND APPARATUS FOR PROCESSING MARKUP LANGUAGE SPECIFICATIONS FOR DATA AND METADATA USED INSIDE MULTIPLE RELATED INTERNET DOCUMENTS TO NAVIGATE, QUERY AND MANIPULATE INFORMATION FROM A PLURALITY OF OBJECT RELATIONAL DATABASES OVER THE WEB. **USPN:** 6,418,448.

Art Unit: 2122

44. **Title:** Automated creation of an XML dialect and dynamic generation of a corresponding DTD. **USPN:** 6,519,617.
45. **Title:** Market makers using documents for commerce in trading partner networks. **USPN:** 6,125,391.
46. **Title:** Automatic transmission of legacy system data. **USPN:** 5,857,194.
47. **Title:** Communication schema of online system and method of ordering consumer product having specific configurations. **USPN:** 6,609,108.
